

Moodle integration

Ally will be integrated into Moodle through 2 components:

1. A Javascript library that gets included on each page. This library is responsible for:
 - a. detecting when a Moodle resource is being referenced and whether to augment it with its Ally Accessibility indicator and/or alternative accessible versions drop down.
 - b. Showing the feedback screens to the instructors when they are improving a file
2. A Moodle “local plugin” that is responsible for:
 - a. Notifying Ally of new or updates file resources through Moodle’s Event mechanism or using the Cron module.
 - b. Securely retrieving data from the Ally REST API so it can be displayed in the page by the JavaScript library.
 - c. Including the JavaScript library on each page that can contain linked resources.
